# Tickborne Diseases

# Lyme Disease and Rocky Mountain Spotted Fever

### **FAST FACTS**

# **April—October**

High season for early localized and early disseminated Lyme disease

~50%

of Lyme disease cases occur during June and July

~50%

of RMSF cases do not report tick bite

### WHEN TO REFER

If concerns for RMSF: Refer to the emergency department for immediate care. RMSF usually requires hospitalization and inpatient management.

If concerns for Lyme disease with signs of meningitis: Refer to the emergency department.

If concerns for persistent or worsening Lyme disease symptoms after treatment: Refer to the emergency department. These symptoms can include arthritis and carditis.

For urgent issues or to speak with a pediatric infectious disease on call 24/7, call the Physician Priority Link® at 1-888-987-7997. Due to various factors, the incidence of tickborne diseases, especially Lyme disease, is rising in the Midwest. This tool provides guidance for assessing and treating Lyme disease and Rocky Mountain Spotted Fever (RMSF). Early diagnosis and appropriate, timely treatment is essential.

### **ASSESSMENT**

Perform standard health history and physical exam with probing questions about plausible geographic exposure to ticks. The diagnosis of Lyme disease and most other tickborne diseases relies primarily on recognition of a consistent clinical illness in people who have likely been exposed to ticks.

The following signs and symptoms of Lyme disease and RMSF are often non-specific and can mimic other illnesses.

- · Chills
- Fatigue
- Fever

- Headache
- Muscle and joint aches
- Swollen lymph nodes

Additional signs and symptoms consistent with Lyme disease include:

- Arthritis
- · Isolated facial palsy

 Single or multiple lesions consistent with erythema migrans, the classic "bulls-eye" rash associated with Lyme disease

Additional signs and symptoms consistent with RMSF include:

- · Lack of appetite
- Nausea
- Rash (common but may not appear in early stages of disease)
- Stomach pain
- Vomiting

### HISTORY AND PHYSICAL EXAM RED FLAGS

- For Lyme disease, red flags include signs and symptoms of meningitis, e.g. altered mental status, arthritis, or carditis, which usually manifests as atrioventricular heart block.
- For RMSF, red flags include later signs and symptoms like petechial rash, multi-organ failure, septic shock, meningoencephalitis, necrosis of digits or limbs, severe thrombocytopenia, and hyponatremia.

### **MANAGEMENT**

If concerns for Lyme disease and no signs of meningitis are present, order lab testing and begin treatment (see reverse side for guidance). Do not delay treatment while awaiting laboratory confirmation or because of lack of history of tick bite. See referral guidance at left for other concerns.

The standard testing method for Lyme disease is a two-tier serologic algorithm. Clinical labs may refer to this as Lyme ELISA, Lyme antibody screen, total Lyme antibody or Lyme IgG/IgM. If first-tier result is negative, no further testing is needed. If positive, a second-tier confirmatory test is required. This is either a western immunoblot or an EIA test cleared by the FDA. For guidance refer to <a href="mailto:cdc.gov/mmwr/volumes/68/wr/mm6832a4.htm?s\_cid=mm6832a4\_w">cdc.gov/mmwr/volumes/68/wr/mm6832a4.htm?s\_cid=mm6832a4\_w</a>

If you would like additional copies of this tool, or would like more information, please contact the Physician Outreach and Engagement team at Cincinnati Children's.

Tool developed by Cincinnati Children's physician-hospital organization (known as Tri-State Child Health Services, Inc.) and staff in the James M. Anderson Center for Health Systems Excellence. Developed using expert consensus and informed by Best Evidence Statements, Care Practice Guidelines, and other evidence-based documents as available. This tool is presented for the purpose of educating providers. It should not be considered inclusive of all proper methods of care or exclusive of other reasonable methods of care. The ultimate judgment regarding care of a particular patient must be made by the physician in light of the patient's individual circumstances.

- Nausea
- Rash (common but may not appear in early stages of disease)
- Vomiting

### HISTORY AND PHYSICAL EXAM RED FLAGS

- For Lyme disease, red flags include signs and symptoms of meningitis, e.g. altered mental status, arthritis or carditis, which usually manifests as atrioventricular heart block.
- For RMSF, red flags include later signs and symptoms like petechial rash, multi-organ failure, septic shock, meningoencephalitis, necrosis of digits or limbs, severe thrombocytopenia, and hyponatremia.

### **Treatment For Lyme Disease**

### If erythema migrans (single or multiple lesions) at any age: Doxycycline, 4.4 mg/kg per day, orally, divided into

Order lab testing and begin treatment

- 2 doses (maximum 200 mg/day) for 10 days
- OR: Amoxicillin, 50 mg/kg per day, orally, divided into 3 doses (maximum 1.5 g/day) for 14 days
- OR: Cefuroxime, 30 mg/kg per day, orally, in 2 divided doses (maximum 1 g/day) for 14 days
- OR for a patient unable to take a beta-lactam or doxycycline: Azithromycin, 10 mg/kg/day, orally, once daily for 7 days

### If isolated facial palsy:

Doxycycline, 4.4 mg/kg per day, orally, divided into 2 doses (maximum 200 mg/day), for 14 days

An oral agent as for early localized disease, for 28 days

A single dose of prophylactic doxycycline is only recommended in areas that are highly endemic for Lyme disease (average Lyme disease incidence of >10 confirmed cases/100,000 for a period of 3 consecutive years). Because rates in Hamilton County are currently <2/100,000, prophylactic doxycycline is NOT recommended when tick bites occur in our area.
